

Using Virtual_Robot with Pedropathing and Roadrunner

Virtual_robot includes libraries for Pedropathing 3 (including Ivy) and Roadrunner 1.0.1, with minor modifications as needed for compatibility.

The org.firstinspires.ftc.teamcode package contains pedropathing and roadrunner subpackages that contain code resembling the respective quickstart code, and example opmodes.

It is strongly recommended to use the MecDynamic robot configuration for both Pedropathing and Roadrunner. Both have been tuned for that configuration, as it offers a physics model that is most compatible with the follower algorithms.

Pedropathing and Roadrunner can be used "out of the box" in virtual_robot. For example, try the IvyOpMode example for Pedropathing, and the SplineTest example for Roadrunner.
